In mathematics, a power of two is a number of the form 2^n where n is an integer, that is, the result of exponentiation with number two as the base and integer n as the exponent. In a context where only integers are considered, n is restricted to non-negative values, so we have 1, 2, and 2 multiplied by itself a certain number of times.

By Miranda Sinclair. The powers of numbers are also called exponents. A number, X, to the power of 2 is also referred to as X squared. The number X to the power of 3 is called X cubed. X is called the base number. Calculating an exponent is as simple as multiplying the base number by itself.

In fact, the products form an ascending sequence of consecutive nonpositive powers of two. For the number 0.00390625, the sequence of products is 2^{-7} , 2^{-6} , 2^{-5} , ..., 2^{-1} , 2^0 . Also, all the products, except the last, end with the digit 5; all negative powers of two in decimal form end in 5!

Another solution is to keep dividing the number by two, i.e, do $n = n/2$ iteratively. In any iteration, if $n\%2$ becomes non-zero and n is not 1 then n is not a power of 2. If n becomes 1 then it is a power of 2.

Finding the Power of a Quotient To simplify the power of a quotient of two expressions, we can use the power of a quotient rule which states that the power of a quotient of factors is the quotient of the powers of the factors. For example, look at the following example: $(e^{-2}f^2)^7 = f^{14}e^{-14}$ $(e^{-2}f^2)^7 = f^{14}e^{-14}$
