Series Solutions Of Differential Equations

If a point is not an ordinary point we call it a singular point. The basic idea to finding a series solution to a differential equation is to assume that we can write the solution as a power series in the form, $y(x) = \sum_{n=0}^{\infty} a_n(x - x_0)^n$. $y'(x) = \sum_{n=0}^{\infty} n a_n(x - x_0)^{n-1}$ and then try to determine what the a_n .

Differential Equations - Series Solutions

Assume the differential equation has a solution of the form $y(x) = \sum_{n=0}^{\infty} a_n x^n$. Differentiate the power series term by term to get $y'(x) = \sum_{n=1}^{\infty} n a_n x^{n-1}$ and $y''(x) = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$. Substitute the power series expressions into the differential equation.

Series Solutions of Differential Equations - Calculus Volume 3

The first method that we'll be taking a look at, series solutions, will actually find a series representation for the solution instead of the solution itself. You first saw something like this when you looked at Taylor series in your Calculus class. As we will see however, these won't work for every differential equation.

Differential Equations - Series Solutions to DE's

In mathematics, the power series method is used to seek a power series solution to certain differential equations. In general, such a solution assumes a power series with unknown coefficients, then substitutes that solution into the differential equation to find a recurrence relation for the coefficients.

Power series solution of differential equations - Wikipedia

We now reach a significant step in solving differential equations via series solutions. In order for the expression in (8) to hold for all values of x , it must be the case that the expression in brackets in (8) sums to zero for all values of n . This means that we can write:
$$\sum_{n=0}^{\infty} (a_{n+2} - (2n+1)a_{n+1} + n^2 a_n) x^n = 0$$

SERIES SOLUTIONS OF DIFFERENTIAL EQUATIONS

1. Power series solutions. 1.1. An example. So far we can effectively solve linear equations (homogeneous and non-homogeneous) with constant coefficients, but for equations with variable coefficients only special cases are discussed (1st order, etc.). Now we turn to this latter case and try to find a general method.

second-order differential equation, the general solution contains two parameters (c_0 and c_1), which will be determined by the initial conditions. Since $y(0) = 2$, it is clear that $c_0 = 2$, and then, since $y'(0) = 3$, the value of c_1 must be 3.

In such a case we use the method of power series; that is, we look for a solution of the form The method is to substitute this expression into the differential equation and determine the values of the coefficients Before using power series to solve Equation 1, we illustrate the method on the simpler equation in Example 1.

Using Series to Solve Differential Equations

Many physical applications give rise to second order homogeneous linear differential equations of the form $P_0(x)y'' + P_1(x)y' + P_2(x)y = 0$, where P_0 , P_1 , and P_2 are polynomials. Usually the solutions of these equations can't be expressed in terms of familiar elementary functions.
